1 ABSTRACT

A method and apparatus for dynamically storing objects of an object-
oriented programming application in a LDAP repository so that useful information
from the objects may be read by other applications are disclosed. Embodiments of
the method preferably comprise dynamically determining persistent attributes,
which are a subset of each object's attributes, for each object being stored and
mapping the persistent attributes to LDAP attributes in the LDAP repository.
Embodiments of the invention preferably comprise a persistent data manager that is
a component of the object-oriented programming application and that acts as an
interface to the LDAP repository, storing objects in the LDAP repository when
requested. The objects may be Java objects.
